Specialists in bio ethanol fires

OKO specialise in creating efficient bio ethanol fires & stoves that have been designed to be the most efficient & easiest to use ethanol fires in the world. Our bio ethanol fires have won over 90% of the awards given to ethanol fires in the last 5 years. Unlike most bio ethanol fires on the market OKO combines the aesthetic beauty of a real fire with the efficiency of a bio ethanol fire. This is achieved through the use of our unique airFLC combustion technology. Almost 100% of the heat is driven directly into the room making them 9 times more efficient than ethanol fires on the market.

Why choose bio fuel?

What is biofuel?

What is bio fuel?
Bio ethanol is a renewable energy source that is derived from the fermentation process of crops, including sugar cane, corn, wheat, This can be converted into an alcohol fuel to become the product. This fuel can be used to power engines to drive vehicles or to fuel gas.

Why is bio fuel more environmentally friendly?
There are many reasons why. By switching to the use of ethanol, CO₂ from the atmosphere is reduced. When ethanol is produced, it fuel the ethanol produces less CO₂. When vapour released, the CO₂ produced is

Why is bio fuel more environmentally friendly?

Why is bio fuel more environmentally friendly?

The production process starts by growing crops. The crops absorb CO₂ from the atmosphere and release O₂. When harvested and used as fuel, the carbon products (H₂, CO, C₆H₁₂O₆) that the CO₂ produced is then released by the burning of crops, making it a sustainable cycle.

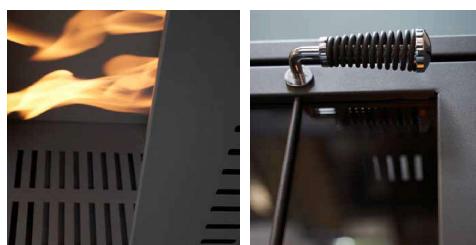

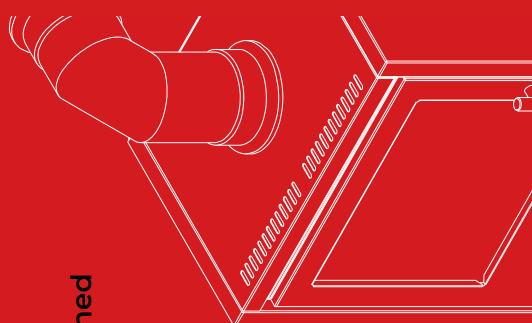

Why make the switch?

OKO Bio Ethanol Fires is part of Fired Up Corporation Ltd

British Designed

OKO Fires & Stoves are designed by our in-house product development team, who collaborate with international manufacturers to bring the best in design and innovation to the market. The stoves and fires are designed to be as efficient and effective as possible. The stoves are available in a variety of models and finishes, and can be delivered to you in a matter of days. Simply choose your space fill & go!

Innovative Technology

airFLO stoves provide a natural flow with instant heat thanks to its unique air flow convection system. The 1.5kW stainless steel burner produces up to 3kW of heat and burns for up to 10 hours depending on the amount of wood used. The air flow is split and entering the surfaces of the air flow will increase the surface temperature of the outer body. The heat is drawn through an opening above the burner so that air can flow across the burner to ignite it.
